1 Data Interests

I'm a pretty indecisive person, so choosing topics and such is hard. But I would say for the most part I am interested in economic questions like development and gender gaps, so any data from possibly the world bank or government websites on stuff like that. Or I have a degree in history, so I am really interested in medieval history and would love to look at data such as old texts or data on artifacts from archaeological sites. Right now a lot of cool stuff is happening in Scandinavia, with lots of excavations finding new things in melting ice or new technologies and techniques being used to go back over old artifacts. I don't know where to find that kind of stuff cause a lot of it is probably in another language or something, but that would be cool to look into I think.

2 Question 6 continued

4. data.frame, SparkR

5. If you run the command on df1 you get an error message. I think this happens because the command does not work for the basic data frame format.

6. Same as in 6.5, if you run the command with df1 you get an error message, presumably because the data file and command are incompatible.
